CONSULTING

## Scotland's Farm Advisory Service

The Farm Advisory Service (FAS) is funded by the EU and Scottish Government to help farmers and crofters to increase the profitability and sustainability of their businesses.

## Introduction

Forward planning forage supplies helps understand whether you will have enough conserved forage to meet the livestock demand - this is becoming more critical as weather is fluctuating more from the seasonal norms. SAC Consulting have produced this booklet on behalf of FAS to provide a few options that may help. These simple clear messages can then be adapted for an individual circumstance. Contact the FAS advice line or your local consultant to discuss further, contact details are on the back cover.

## Know the Starting Point-Feed Budgeting

A key part of planning is to know how much feed is available and roughly how much you need. The following pages present tables showing the number of animal feeding days supplied by either one 700 kg bale of silage or one cubic metre of pit silage for the main beef, sheep and dairy enterprises. The number of animal feed days will depend on how wet the silage is, i.e. its dry matter (DM), and its energy content, measured as metabolisable energy (ME). So to utilise this information you need -

- Your silage analysed to measure its dry matter and energy content, i.e. its feed value.
- To weigh some bales and/or measure the height x width x depth of your silage clamp.
- The following tables are an early guide to whether you have enough forage - a farm specific plan should be carried out once the silage analysis is available.

## How Much Fodder is Needed?

## SPRING CALVING BEEF COWS

Animal feed days per bale of silage or $\mathrm{m}^{3}$ of clamp silage

|  | 9.5ME |  | 10.5ME |  |
| :--- | :---: | :---: | :---: | :---: |
| DM\% | Bale | Clamp | Bale | Clamp |
| 20 | 15 | 16 | 18 | 18 |
| 25 | 19 | 18 | 22 | 21 |
| 30 | 23 | 20 | 26 | 23 |
| 35 | 26 | 23 | 30 | 26 |
| 40 | 30 | 25 | 35 | 30 |
| Assumptions: 650kg cow losing $0.25 \mathrm{~kg} / \mathrm{d} .700 \mathrm{~kg}$ bale for all dry matters. 10\% wastage. |  |  |  |  |

## Examples:

- A 100 cow herd housed for 120 days is 12,000 cow days. The bale silage is $35 \%$ drymatter and 9.5 ME so one bale provides 26 cows feed for a day. Requirement would be 461 bales.
$12,000 \div$ 26 cows/bale

$$
=461 \text { bales }
$$

- A 200 cow herd housed for 150 days is 30,000 cow days. The pit silage is $20 \%$ dry matter and 10.5 ME so provides 18 cows feed for a day per $\mathrm{m}^{3}$. Requirement would be $1667 \mathrm{~m}^{3}$ of silage.

## Notes:

- Condition score and weight of the cows will affect the amount to be fed.
- As a guide - if you add straw into the ration, containing average grass silage, for every 1 kg of straw added take out 3 kg of silage.
- Be aware of low protein levels in the diet particularly if feeding straw with silage - this can have serious consequences, so seek advice.

## AUTUMN CALVING BEEF COWS

Animal feed days per bale of silage or $\mathrm{m}^{3}$ of clamp silage

|  | 9.5 ME |  | 10.5 ME |  |
| :--- | :---: | :---: | :---: | :---: |
| DM\% | Bale | Clamp | Bale | Clamp |
| 20 | 11 | 12 | 10 | 11 |
| 25 | 13 | 13 | 13 | 13 |
| 30 | 16 | 15 | 16 | 15 |
| 35 | 21 | 17 | 19 | 17 |
| 40 | 22 | 19 | 21 | 19 |
| Concentrates kg/day |  | 2.3 |  | 1.1 |

Assumptions: 650 kg cow with 8 kg milk and losing $0.15 \mathrm{~kg} / \mathrm{d}$. 700 kg bale for all dry matters. $10 \%$ wastage.

## Examples:

- A 100 cow herd inside for 120 days is 12,000 cow days. If their bale silage is $40 \%$ dry matter and 10.5ME one bale feeds 22 cows for a day. Requirement would be 545 bales.
- A 200 cow herd inside for 150 days is 30,000 cow days. If their pit silage is $25 \%$ dry matter and 10.5 ME it will feed 13 cows for a day per $\mathrm{m}^{3}$. Requirement would be $2,307 \mathrm{~m}^{3}$ of silage.

## Notes:

- Silage requirement includes intake from calf at foot
- Condition and weight of the cows will affect the amount to be fed
- Be aware of low protein levels in the diet and supplement appropriately

## STORE CATTLE

Animal feed days per bale of silage or $\mathrm{m}^{3}$ of clamp silage

|  | 9.5 ME |  | 10.5ME |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| DM\% | Bale | Clamp | Bale | Clamp |  |  |  |  |  |
| 20 | 32 | 33 | 29 | 30 |  |  |  |  |  |
| 25 | 41 | 38 | 36 | 34 |  |  |  |  |  |
| 30 | 51 | 42 | 43 | 38 |  |  |  |  |  |
| 35 | 57 | 49 | 50 | 43 |  |  |  |  |  |
| 40 | 66 | 56 | 59 | 50 |  |  |  |  |  |
| Concentrate allowance kg/hd/day | 3.8kg |  |  |  |  |  |  |  | 2.9kg |
| Assumptions: 350kg steer gaining 0.8kg/day. 700kg bale for all dry matter. 10\% wastage. |  |  |  |  |  |  |  |  |  |

## Examples:

- 80 store cattle inside for 180 days is 14,400 animal days. If a bale of silage is $35 \%$ dry matter and has an energy content of 9.5 ME then each bale will feed 57 stores for a day. This gives a total requirement of 253 bales.
- For 130 store cattle wintered for 150 days would be a total of 19,500 animal days. If the clamp silage is $25 \%$ dry matter with an energy content of 10.5 ME each cubic meter would provide feed 34 stores for a day. This would give a total requirement of 575 cubic meters.

## WARNING

- To avoid digestive upsets do not feed more than 0.5 kg of concentrates/100 kg of liveweight/feed at any one time e.g. for 350 kg steer a maximum of $350 \times 0.5 \div 100=$ $1.75 \mathrm{~kg} /$ feed

## FINISHING CATTLE

Animal feed days per bale of silage or $\mathrm{m}^{3}$ of clamp silage

|  | 10.5ME |  | 11.5ME |  |
| :--- | :---: | :---: | :---: | :---: |
| DM\% | Bale | Clamp | Bale | Clamp |
| 20 | 24 | 25 | 21 | 21 |
| 25 | 29 | 28 | 25 | 24 |
| 30 | 36 | 32 | 31 | 27 |
| 35 | 42 | 36 | 36 | 31 |
| 40 | 48 | 40 | 41 | 34 |
| Concentrate allowance kg/hd/day | 5.5 |  |  |  |

Assumptions: 550 kg steer gaining $1 \mathrm{~kg} /$ day. 700 kg bale for all dry matters. $10 \%$ wastage.

## Examples:

- For 90 finishing cattle with a 150 day finishing period the total requirement would be 13,500 feed days. With bales at $40 \%$ dry matter and with an energy content of 10.5ME each bale would feed 48 animals for a day. This would give a total requirement of 280 bales.
- For 150 finishing cattle with an average 180 day finishing period the total requirement would be 27,000 feed days. Using pit silage at $25 \%$ dry matter and an energy value of 11.5ME each cubic meter would feed 24 animals for a day. This gives a total winter requirement of $1,125 \mathrm{~m}$ cubic meters. With a clamp height of 2 m high and a face 9 m wide, 62.5 m length would be needed to provide 1,125 cubic meters of silage.

## WARNING

- To avoid digestive upsets do not feed more than 0.5 kg of concentrates per 100 kg of liveweight per feed at any one time.

## UPLAND EWES

Animal feed days per bale of silage or $\mathrm{m}^{3}$ of clamp silage

|  | 9.5 ME |  | 11.5ME |  |
| :--- | :---: | :---: | :---: | :---: |
| DM\% | Bale | Clamp | Bale | Clamp |
| 20 | 141 | 146 | 98 | 101 |
| 25 | 177 | 167 | 122 | 115 |
| 30 | 212 | 186 | 148 | 130 |
| 35 | 245 | 210 | 172 | 147 |
| 40 | 277 | 233 | 193 | 163 |
| Concentrate allowance kg/hd/day | 0.75 |  |  |  |
| 年 |  | 0.15 |  |  |

Assumptions: 75 kg ewe, no weight change. Carrying twin lambs, 3 weeks before lambing.
700 kg bale for all dry matters. $10 \%$ Wastage.

## Notes:

- If a hay based ration, assuming average hay of $8.5 \mathrm{MJ} \mathrm{ME} / \mathrm{kgDM}$ and bales weighing 200kg:- one bale will feed roughly 200 lowland sheep for a day, at 3 weeks from lambing. Supplementation with a concentrate will be necessary (around $0.8 \mathrm{~kg} / \mathrm{head} /$ day).

## WARNING

- Feeding concentrates over $0.4-0.5 \mathrm{~kg} / \mathrm{head} /$ day should be fed in two feeds to avoid digestive upsets.

## HILL EWES

Animal feed days per bale of silage or $\mathrm{m}^{3}$ of clamp silage

|  | 9.5ME |  | 11.5ME |  |
| :--- | :---: | :---: | :---: | :---: |
| DM\% | Bale | Clamp | Bale | Clamp |
| 20 | 177 | 183 | 125 | 129 |
| 25 | 219 | 207 | 155 | 146 |
| 30 | 265 | 233 | 187 | 164 |
| 35 | 303 | 260 | 219 | 188 |
| 40 | 354 | 298 | 255 | 215 |
| Concentrate allowance kg/hd/day | 0.5 |  |  |  |

Assumptions: 60 kg ewe, no weight change. Carrying a single lamb, 3 weeks before lambing. 700 kg bales for all dry matters. $10 \%$ wastage.

## Examples:

- For a 600 flock of hill ewes fed silage for 40 days the total number of ewe feeding days would be 24,000 feeding days. For $40 \%$ dry matter baled silage with an energy content of 9.5 ME , one bale would feed 354 ewes for a day. This would give a total requirement of 68 bales for the winter.

## Notes:

- If a hay based ration, assuming average hay of $8.5 \mathrm{MJ} \mathrm{ME/kgDM}$ and bales weighing 200kg:- one bale will feed roughly 260 hill ewes at 3 weeks from lambing. Supplementation with a concentrate will be necessary (around $0.5 \mathrm{~kg} / \mathrm{head} / \mathrm{day}$ ).

## WARNING

- Feeding concentrates over 0.4-0.5kg/day should be fed in two feeds to avoid digestive upsets.

## LACATATING AND DRY DAIRY COWS

As the majority of dairy cows are fed TMR we have used 3 different proportions of silage in the TMR.

Animal feed days per bale of silage or $\mathrm{m}^{3}$ of clamp silage

|  | 8kg DM intake |  | 10kg DM intake |  | 12kg DM intake |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| DM\% | Bale | Clamp | Bale | Clamp | Bale | Clamp |  |  |  |  |
| 20 | 15 | 17 | 12 | 14 | 10 | 11 |  |  |  |  |
| 25 | 19 | 19 | 15 | 15 | 13 | 13 |  |  |  |  |
| 30 | 23 | 21 | 18 | 16 | 15 | 14 |  |  |  |  |
| 35 | 27 | 22 | 22 | 17 | 18 | 15 |  |  |  |  |
| 40 | 31 | 23 | 25 | 18 | 21 | 15 |  |  |  |  |
| Assumptions :700kg bales for all dry matters. $10 \%$ wastage. |  |  |  |  |  |  |  |  |  |  |

## Examples:

- A 150 cow herd inside for a 210 day winter is 31,500 cow days. If the pit silage is $30 \%$ DM and fed at 10 kg DM/cow $1 \mathrm{~m}^{3}$ should feed 16 cows for a day. This gives a total requirement of $1970 \mathrm{~m}^{3}$.
- For 40 dry cows inside for a 210 day winter is 8,400 cow days. If the bale silage is $35 \%$ DM and fed at 8 kg DM/cow each bale should feed 27 cows for a day. This gives a total requirement of 311 bales.

## Notes:

Breed or weight of the cow and concentrate use will affect the amount of silage to be fed, as well as other forages available (wholecrop or maize silage). The same calculations apply to maize silage and wholecrop cereals as bulk densities will be similar. For young stock see store cattle section.

## For more information contact:

## Advice line

For free telephone advice on a wide variety of topics including cross compliance,water framework directive requirements, climate change and other technical issues call us on 03003230161 or email advice@fas.scot. The advice line operates between 9am and 5pm Monday to Friday.

## Bespoke Advice and Grants

FAS can also help you to increase the profitability and sustainability of your farming business through Scottish Government grants including Integrated Land Management Plans (ILMPs) - worth up to $£ 1,200$. The ILMP will identify opportunities and cost savings for your business, based on an independent and confidential assessment of your business by an experienced farm business adviser of your choosing. As part of your plan you can choose to benefit from up to two further specialist advice plans.
